# Week 1 Quiz

20/20 questions correct

Quiz passed!

Continue Course (/learn/r-programming/lecture/QLz9h/introduction-to-swirl)

Back to Week 1 (/learn/r-programming/home/week/1)

1

R was developed by statisticians working at

- The University of New South Wales
- O Harvard University
- Bell Labs
- The University of Auckland

#### Well done!

The R language was developed by Ross Ihaka and Robert Gentleman who were statisticians at the University of Auckland in New Zealand.

2.

The definition of free software consists of four freedoms (freedoms 0 through 3). Which of the following is NOT one of the freedoms that are part of the definition? Select all that apply.

The freedom to study how the program works, and adapt it to your needs.

# Well done!

This is freedom 1.

The freedom to prevent users from using the software for undesirable purposes.

#### Well done!

This is not part of the free software definition. Freedom 0 requires that the users of free software be free to use the software for any purpose.

The freedom to sell the software for any price.

# Well done!

This is not part of the free software definition. The free software definition does not mention anything about selling software (although it does not disallow it).

The freedom to redistribute copies so you can help your neighbor.

16/2/2016 Week 1 Quiz | Coursera

Well done! This is freedom 2.		
The freedom to improve the program, and release your improvements to the public, so that the whole community benefits.		
Well done! This is freedom 3.		
The freedom to restrict access to the source code for the software.		
Well done! This is not part of the free software definition. Freedoms 1 and 3 require access to the source code.		
The freedom to run the program, for any purpose.		
Well done! This is freedom 0.		
3.  In R the following are all atomic data types EXCEPT: (Select all that apply)		
character		
Well done!		
matrix		
Well done! 'matrix' is not an atomic data type in R.		
array		
Well done!  'array' is not an atomic data type in R.		
list		
Well done!  'list' is not an atomic data type in R.		
logical		
Well done!		
numeric		
Well done!		
integer		
Well done!		

	complex
Wel	done!
	data frame
	l done! a frame' is not an atomic data type in R.
	table
	done! e' is not an atomic data type in R.
<b>~</b>	4.
If I exe functio	cute the expression $x < -4$ in R, what is the class of the object `x' as determined by the `class()' n?
0	complex
0	integer
0	numeric
Wel	I done!
0	matrix
0	real
0	list
0	vector
<b>~</b>	5.
What is	s the class of the object defined by x <- c(4, TRUE)?
0	logical
0	character
0	list
	matrix
	numeric
The	l done! numeric class is the "lowest common denominator" here and so all elements will be coerced that class.
0	integer

6.		
If I have two vectors $x <- c(1,3,5)$ and $y <- c(3,2,10)$ , what is produced by the expression cbind( $x$ , $y$ )?		
O a 3 by 3 matrix		
O a 2 by 3 matrix		
a 2 by 2 matrix		
a matrix with 2 columns and 3 rows		
Well done! The 'cbind' function treats vectors as if they were columns of a matrix. It then takes those vectors and binds them together column-wise to create a matrix.		
O a vector of length 2		
a vector of length 3		
<b>✓</b> 7.		
A key property of vectors in R is that		
the length of a vector must be less than 32,768		
elements of a vector can be of different classes		
elements of a vector all must be of the same class		
Well done!		
O elements of a vector can only be character or numeric		
a vector cannot have have attributes like dimensions		
<b>✓</b> 8.		
Suppose I have a list defined as $x <-$ list(2, "a", "b", TRUE). What does $x[[2]]$ give me? Select all that apply.		
a character vector of length 1.		
Well done!		
a list containing the number 2 and the letter "a".		
Well done!		
a character vector containing the letter "a".		
Well done!		
a list containing character vector with the letter "a".		

a character vector with the elements "a" and "b".

Well done!		
<b>~</b>	9.	
	se I have a vector x <- 1:4 and a vector y <- 2. What is produced by the expression x + y?	
0	an integer vector with elements 3, 2, 3, 6.	
0	an integer vector with elements 3, 2, 3, 4.	
0	a numeric vector with elements 3, 2, 3, 6.	
0	a numeric vector with elements 3, 2, 3, 4.	
0	a numeric vector with elements 1, 2, 3, 6.	
0	a numeric vector with elements 3, 4, 5, 6.	
Wel	I done!	
110	i done.	
<b>~</b>	10.	
	se I have a vector x <- c(17, 14, 4, 5, 13, 12, 10) and I want to set all elements of this vector that are r than 10 to be equal to 4. What R code achieves this? Select all that apply.	
	$x[x \ge 10] < 4$	
Wel	I done!	
This	takes the elements of x that are greater than or equal to 10 and sets them to 4.	
	x[x > 10] <- 4	
<u> </u>		
	<b>I done!</b> can create a logical vector with the expression $x > 10$ and then use the [ operator to subset the	
orig	nal vector x.	
	x[x == 10] <- 4	
Wel	l done!	
	takes the elements of x that are equal to 10 and sets them to 4.	
	x[x < 10] <- 4	
Wel	I done!	
	takes the elements of x that are less than 10 and sets them to 4.	
	x[x > 10] == 4	
	I done!	
This	takes the elements of x that are greater than 10 and tests whether they are equal to 4 or not.	
	x[x > 4] < -10	
Wel	l done!	

This takes the elements of x that are greater than 4 and sets them to 10.

# Well done!

You can create a logical vector with the expression  $x \ge 11$  and then use the [operator to subset the original vector x.

x[x == 4] > 10

#### Well done!

This takes the elements that are equal to 4 and tests whether they are greater than 10 or not.

Use the Week 1 Quiz Data Set (https://d396qusza40orc.cloudfront.net/rprog/data/quiz1\_data.zip) to answer questions 11-20.

In the dataset provided for this Quiz, what are the column names of the dataset?

1, 2, 3, 4, 5, 6

Ozone, Solar.R, Wind

Month, Day, Temp, Wind

Ozone, Solar.R, Wind, Temp, Month, Day

#### Well done!

You can get the column names of a data frame with the `names()' function.

Extract the first 2 rows of the data frame and print them to the console. What does the output look like?

Ozone Solar.R Wind Temp Month Day 1 18 224 13.8 67 9 17 7 22 2 258 9.7 NA 81

Ozone Solar.R Wind Temp Month Day 1 9 24 10.9 71 9 14 2 18 131 8.0 76 9 29

Ozone Solar.R Wind Temp Month Day 5 11 1 NA 6.9 35 274 10.3

Ozone Solar.R Wind Temp Month Day 190 7.4 67 118 8.0 72 5 36

### Well done!

You can extract the first two rows using the [ operator and an integer sequence to index the rows.
