Week 4 Quiz

10 questions

1

What is produced at the end of this snippet of R code?

	seed(1) s(5, 2)
0	A vector with the numbers 3.3, 2.5, 0.5, 1.1, 1.7
0	A vector with the numbers 1, 4, 1, 1, 5
0	It is impossible to tell because the result is random
0	A vector with the numbers 1, 1, 2, 4, 1
2. What I	R function can be used to generate standard Normal random variables?
0	qnorm
0	dnorm
0	rnorm
0	pnorm
3. When	simulating data, why is using the set.seed() function important? Select all that apply.
	It ensures that the sequence of random numbers is truly random.
	It ensures that the sequence of random numbers starts in a specific place and is therefore reproducible.
	It can be used to generate non-uniform random numbers.
	It ensures that the random numbers generated are within specified boundaries.
4. Which distrib	function can be used to evaluate the inverse cumulative distribution function for the Poisson ution?
0	qpois
0	dpois
0	rpois
0	ppois

5.

What does the following code do?

```
set.seed(10)
x <- rep(0:1, each = 5)
e <- rnorm(10, 0, 20)
y <- 0.5 + 2 * x + e</pre>
```

Generate data from a Normal linear model

O Generate random exponentially distributed data

Generate data from a Poisson generalized linear model

• Generate uniformly distributed random data

6.

What R function can be used to generate Binomial random variables?

O pbinom

O dbinom

rbinom

O qbinom

7.

What aspect of the R runtime does the profiler keep track of when an R expression is evaluated?

- the global environment
- the working directory
- the function call stack
- the package search list

8.

Consider the following R code

```
library(datasets)
Rprof()
fit <- lm(y ~ x1 + x2)
Rprof(NULL)</pre>
```

(Assume that y, x1, and x2 are present in the workspace.) Without running the code, what percentage of the run time is spent in the 'lm' function, based on the 'by.total' method of normalization shown in 'summaryRprof()'?

It is not possible to tell

23%

(100%

O 50%

9.

When using 'system.time()', what is the user time?

20/2/2016 Week 4 Quiz | Coursera

U	It is the time spent by the CPU waiting for other tasks to finish
0	It is a measure of network latency
0	It is the "wall-clock" time it takes to evaluate an expression
0	It is the time spent by the CPU evaluating an expression
0. a co	mputer has more than one available processor and R is able to take advantage of that, then which of
	llowing is true when using 'system.time()'?
	·
	llowing is true when using 'system.time()'?
	llowing is true when using 'system.time()'? user time is 0
	llowing is true when using 'system.time()'? user time is 0 elapsed time is 0
	llowing is true when using 'system.time()'? user time is 0 elapsed time is 0 user time is always smaller than elapsed time
